Experience

ENUT Technologies Pvt. Ltd.
Hyderabad - India

May 2026 - Till Date

Gained hands-on experience in software development by working on real-time projects and practical development tasks.
Contributed to project activities while understanding the complete software development process and workflow.
Developed strong technical and problem-solving skills by identifying issues and working on effective solutions.
Collaborated with team members, participated in discussions, and improved communication and teamwork skills.
Gained practical knowledge of applying technical concepts in real-world projects while meeting project requirements and deadlines.

Education

Ace Engineering College 2023 - 2027

Bachelor of Technology in Electronics and Communication Engineering

Skills Summary

- Design Process
- UX Research
- User Interface
- Problem Solving
- User Flow Design
- Wireframing
- Visual Design
- Responsive Design
- Design System
- Information Architecture

Projects

RIDE MATE

Project Overview

RideMate is a community-driven mobile platform designed to help riders connect with fellow riders, discover and join group rides, maintain their bikes, find nearby services, and get quick assistance during emergencies. The goal was to create a simple, reliable, and rider-focused experience that brings essential riding needs together in one platform.

Problem Statement

Riders often face difficulties finding the right riding communities and connecting with people who share similar riding interests. They also lack quick access to help during breakdowns or accidents, may overlook regular bike maintenance, and often find it inconvenient to locate nearby bike-related services.

Target Users

- Individual bike riders and motorcycle enthusiasts
- Riders looking to join or create group rides
- New riders seeking riding communities and guidance
- Riders who need bike maintenance and nearby services
- Riders who require quick assistance during emergencies

Solution

Designed RideMate as an all-in-one rider platform that simplifies community discovery, ride planning, bike care, and emergency assistance. The experience allows users to discover and connect with riders, join or create rides, manage bike maintenance, find nearby services, and access an emergency SOS feature when needed.

Design Process

- Research: Identified common challenges faced by riders through user research and understanding their needs and behaviors.
- Define: Organized key pain points and defined the major problems the product needed to solve.
- Ideate: Explored different solutions and created user flows to simplify important rider tasks.
- Wireframing: Created low-fidelity wireframes to structure the screens, content, and navigation.
- UI Design: Developed high-fidelity screens in Figma with a clean, modern, and rider-focused visual language.
- Prototyping: Created interactive prototypes to demonstrate the complete user experience and key interactions.
- Usability Testing: Tested the flows with users to identify usability issues and understand their feedback.
- Iteration: Improved and simplified the experience based on user feedback, particularly the flow for discovering and joining riding communities.

Key Features

- Connect with Riders
- Join & Create Rides
- Bike Care & Maintenance
- Emergency SOS
- Nearby Bike Services
- Riding Community Discovery
